# Morning light and study focus in college students

A fictional paper made for the Appuscholar tests. The study and the numbers do not exist.

## Abstract

We asked whether ten minutes of morning daylight helped students keep their focus while studying. Forty students from one college took part. Focus was rated after a one-hour study session. Students who went outside in the morning rated their focus higher than students who stayed in.

Method

Each student was placed in a light group or an indoor group by drawing lots.

Focus was rated from 1 to 10 at the end of the session.

Limitations

The sample was small and came from one college, and focus was self-rated.
